ABSTRACT

The Smart Restaurant Ordering and Kitchen Display System is a backend system that makes restaurant order management easier and faster. Customers can view the menu, place orders, and track their order status. The orders are stored in a database and automatically displayed on a Kitchen Display System (KDS) for kitchen staff. Kitchen staff can update orders from New → Accepted → Preparing → Ready → Served. The backend manages users, menu items, tables, orders, payments, and order status using REST APIs and a relational database. The system helps reduce manual errors, improve communication, and make restaurant operations more organized and efficient.

INTRODUCTION

The Smart Restaurant Ordering and Kitchen Display System is a simple digital system that makes restaurant ordering easier and faster. Customers can view the menu, place orders, and check their order status. Kitchen staff can easily view and manage orders. The system helps reduce mistakes, save time, and improve communication between customers and the kitchen. It also keeps all order details organized in one place. Overall, the system helps restaurants provide better and more efficient service.

EXISTING SYSTEM

In the existing system, restaurant orders are mostly taken manually by waiters. Customers tell their orders to the staff, and the information is passed to the kitchen. This can cause mistakes, delays, and miscommunication. It is also difficult to track the order status and manage many orders at the same time. Order details may be written on paper or handled through different systems, making them difficult to manage. Kitchen staff may also miss or delay orders during busy hours. Overall, the traditional system requires more manual work and is less efficient.

ORDER		
Burger	x2	₹240
Pasta	x1	₹180
Juice	x1	₹80
Total		₹500

PROBLEM

Traditional restaurant ordering involves a lot of manual work, which can lead to order mistakes, delays, and poor communication between customers, waiters, and kitchen staff. It is also difficult to track orders and manage them efficiently during busy hours. Therefore, there is a need for a simple digital system that can manage restaurant orders, update order status, and improve communication between the kitchen and customers.

SOLUTION(Contribution)

Our system provides a digital platform for restaurant order management. Customers can view the menu, place orders, and track their order status. Kitchen staff can view incoming orders and update them from New → Accepted → Preparing → Ready → Served. The backend stores all order details in a database and manages them through REST APIs. This reduces manual errors, saves time, and improves communication between customers and kitchen staff.

Objectives

To make restaurant ordering simple and fast.

To reduce manual errors and delays.

To manage orders efficiently using a digital system.

To help kitchen staff view and update orders easily.

To allow customers to track their order status.

To improve communication between customers and kitchen staff.

Modules

FRONTEND MODULES

Smart Restaurant Ordering and Kitchen Display System

SOFTWARE REQUIREMENTS

ORDER TRACKING

Node.js – Used for developing the server-side/backend of the system.

MySQL – Used to store and manage user, menu, order, table, and payment data.

HTML, CSS, JavaScript – Used to develop the user interface.

MySQL Workbench – Used for database design and management.

Visual Studio Code (VS Code) – Used as the primary development environment.

Git & GitHub – Used for version control and project collaboration.

CONCLUSION AND FUTURE SCOPE

Conclusion:

The system provides a simple and efficient way to manage restaurant orders digitally. It reduces manual work, minimizes errors, and improves communication between customers and kitchen staff. The Kitchen Display System also helps staff manage orders and update their status easily.

Future Scope:

- ✓ Online payment integration
- ✓ Real-time order notifications
- ✓ Mobile application AI-based food recommendations
- ✓ Sales and order analytics
- ✓ Better admin and restaurant management features

THANK YOU
